

Analysis landBustamante
Samuel Rengifo
A00404150

Input:

The user must type the following variables:

double landPerimeter

Output:

The data showed to the user will be:

double groundHeight

double groundArea

Analysis:

Sr. Bustamante has a big problem which is that he forgot what was the height of his own land, so he needs help to calculate this one. The console will ask just for the land perimeter to the user and it will calculate and then it will display on screen the final ground height of the land and the area.
